

Tenant Update Instructions

These instructions show how to install an Archer update in your organization's Google Cloud project. It takes about 10 minutes, mostly waiting. Your knowledge bases, documents and settings stay as they are.

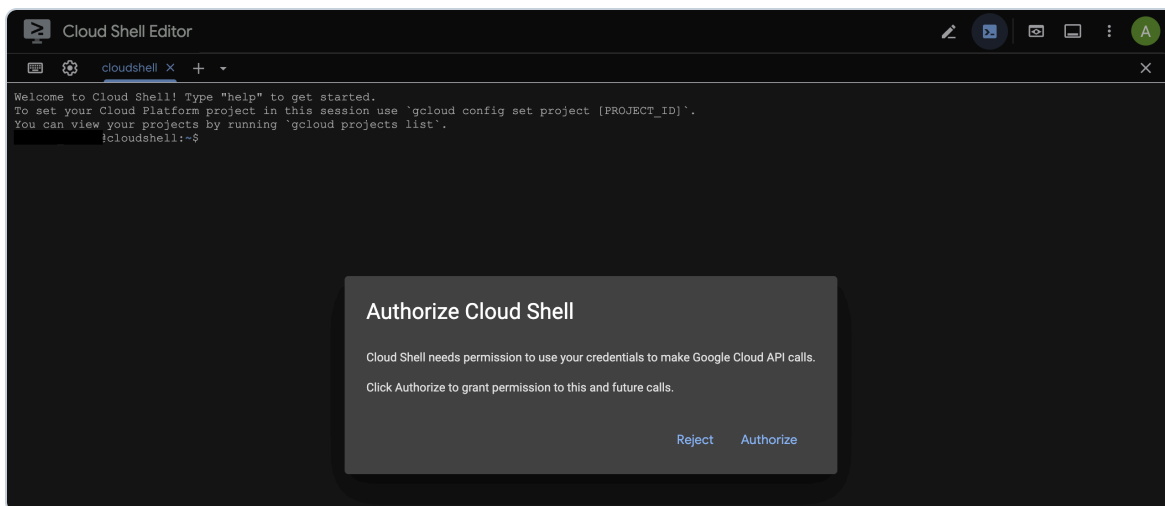

When to run the update

- **When Atharch announces an update.** The notice tells you the new version.
- **When all your knowledge bases suddenly stop answering.** This usually means the Gemini API prepaid credits ran out. The update command checks the Gemini API billing and shows you how to fix it, even when there is nothing to update.

Sign in with the **dedicated Google account** that owns your Archer project (the one used for the setup).

1 Open Google Cloud Shell

Signed in with the dedicated account, open shell.cloud.google.com. Click **Authorize** if Google asks.

If Cloud Shell asks for permission, click Authorize.

2 Run the update command

Paste this command and press **Enter**. Use the same command for every update; it always downloads the latest version.

```
curl -fsSL0 https://www.atharch.com/assets/downloads/tenant-tools/archer-tenant-update.py &&
python3 archer-tenant-update.py
```

Keep the window open while the script works. When a Google service needs a few minutes, the script waits and tries again by itself.

3 Answer the questions

- **Continue with this account?** Answer **y** only if it shows the dedicated account.
- **Your project:** enter the number or the ID of your Archer project. If it is the only one, press Enter.
- **Update ... to version ... now?** Press Enter to install the update.
- If the new version is already installed, the script asks **Deploy it again anyway?** instead. Press Enter (no). The script then only checks the Gemini API billing.

```
[3/8] Firebase project
Your Firebase projects:
  1) acme-public-library-archer-kb (Acme Public Library)
Enter the number or the project ID [acme-public-library-archer-kb]:

[4/8] Version check
Deployed version: 2026.10.24.1020
New version:      2026.11.03.1000
Update acme-public-library-archer-kb to version 2026.11.03.1000 now? [Y/n]:
```

Example: choosing the project and confirming the update.

4 Gemini API billing check

At the end, the script makes a short test request to check that the Gemini API billing works. If it does not, for example because the prepaid credits ran out, the script shows the steps and waits:

1. Open aistudio.google.com/projects with the dedicated account and click **Billing** in the left menu.
2. Click **Buy credits** and add credits (at least 5 US dollars).
3. Click **Set up auto-reload** and turn it on, so that this does not happen again.
4. Go back to Cloud Shell and press **Enter**. If you cannot finish now, type **later**, and run the update command again when the billing is ready.

Google AI Studio, Billing: buy credits and set up auto-reload.

5 Reply to Atharch

When the update is complete, the script shows one line to send back. Reply to Atharch's update notice with that line.

```
Update complete: acme-public-library-archer-kb now runs version 2026.11.03.1000.
Please reply to Atharch's update notice with: "acme-public-library-archer-kb updated to 2026.11.03.1000".
```

Example: the end of the update.

If something goes wrong

- **Run the same command again.** Most problems are temporary. This also works after Cloud Shell disconnects.
- **Get help:** each run saves a log file in `~/archer-tenant/logs`. If the same step fails twice, send it to your Atharch contact.

If the script says	Do this
No Firebase projects were found for this Google account	Sign in with the dedicated account, then run the command again
Project ... has not been set up for Archer yet	Follow the <i>Tenant Setup Instructions</i> first
The deployed version is newer than the package on the website	Nothing was changed. Contact Atharch
The functions package failed its signature check	Stop and contact Atharch
The Gemini API billing is not set up for this project yet	Do step 4, then press Enter

Keep in mind

- **Use the project only for Archer.** An update replaces the Cloud Functions in the project, so do not add other applications or Cloud Functions to it.
- **Keep Auto-reload on** for your Gemini API credits. When the credits run out, all your knowledge bases stop answering until you add credits.
